- Toxicity to fish: no data available
- Toxicity to daphnia and other aquatic invertebrates: no data available
- Toxicity to algae: no data available
- Toxicity to microorganisms: no data available

**12.2 Persistence and degradability**

1-Pentene at 500 mg/l was inoculated with activated sludge and the oxidation of this compound measured; 0.5 to 0.8 percent of the theoretical oxygen demand was reached within a 24 hour period(1). While biodegradation data in soil and water environments were not located, 1-pentene's linear, relatively low molecular weight, hydrocarbon structure suggests that biodegradation in soil and water is expected to be an important fate process(2).

**12.3 Bioaccumulative potential**

An estimated BCF of 22 was calculated for 1-pentene(SRC), using an estimated log Kow of 2.66(1) and a regression-derived equation(2). According to a classification scheme(3), this BCF suggests the potential for bioconcentration in aquatic organisms is low.

**12.4 Mobility in soil**

Using a structure estimation method based on molecular connectivity indices(1), the Koc for 1-pentene can be estimated to be 81(SRC). According to a classification scheme(2), this estimated Koc value suggests that 1-pentene is expected to have high mobility in soil.

**12.5 Other adverse effects**

no data available

---

**SECTION 13: Disposal considerations****13.1 Disposal methods****Product**

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

**Contaminated packaging**

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
