10.1 Reactivity

no data available

10.2 Chemical stability

Gradually loses ammonia in the air changing to ammonium carbonate

10.3 Possibility of hazardous reactions

AMMONIUM CARBAMATE is a carbamate salt. Carbamates are chemically similar to, but more reactive than amides. Like amides they form polymers such as polyurethane resins. Carbamates are incompatible with strong acids and bases, and especially incompatible with strong reducing agents such as hydrides. Flammable gaseous hydrogen is produced by the combination of active metals or nitrides with carbamates. Strongly oxidizing acids, peroxides, and hydroperoxides are incompatible with carbamates. This compound is unstable in an alkaline media (NTP, 1992). Moderate fire and explosion hazards when exposed to heat or flame (USCG, 1999).
