SECTION 10: Stability and reactivity

10.1 Reactivity

This chemical is moisture sensitive. (NTP, 1992). Undergoes slow hydrolysis. Insoluble in water.

10.2 Chemical stability

no data available

10.3 Possibility of hazardous reactions

Isocyanates and thioisocyanates, such as ALPHA-NAPHTHYLISOTHIOCYANATE, are incompatible with many classes of compounds, reacting exothermically to release toxic gases. Reactions with amines, aldehydes, alcohols, alkali metals, ketones, mercaptans, strong oxidizers, hydrides, phenols, and peroxides can cause vigorous releases of heat. Acids and bases initiate polymerization reactions in these materials. Some isocyanates react with water to form amines and liberate carbon dioxide. Base-catalysed reactions of isocyanates with alcohols should be carried out in inert solvents. Such reactions in the absence of solvents often occur with explosive violence, [Wischmeyer(1969)].
